PRIMUS · MARKET SIMULATION

Problem statements and crises

Every problem statement and crisis card in the game, and two extra sectors, in detail: what each one asks of the teams and how the answers are judged.

Luxury FMCG Energy EXTRA: Aviation Fintech

5 Round 1 problem statements: the game's 3 sectors and 2 extra	**1** Round 1 consulting case, the same for every firm	**20** Round 2 crisis cards, four per sector	**50** Round 3 problem statements, ten per sector

How to read this book. Luxury, FMCG and Energy are the game's three sectors: text marked **On screen** is exactly what teams see (it comes from the files the organisers upload: seed/sectors/problem-cards.csv, crisis-cards.csv and statements.csv). **Aviation and Fintech** are two extra sectors with the same parts; their texts are marked **Card text**, because they are not in the three-sector files uploaded today. They are ready to play: seed/sectors/all holds all five sectors, and pnpm sectors writes the files for any mix. Everything around the cards is guidance for organisers, judges and mentors: what each card means, what a strong answer covers and what moves the market.

Fairness. All numbers on the cards are invented for the game and are the same for every company that receives the card. Real startups are named for inspiration only; teams must not copy them, and the judge scores the team's own plan.

Contents

1. How the night uses the statements and crises
2. Round 1 · The consulting case: Kaveri Fresh
3. Luxury: the problem statement, four crises, spare cards and ten Round 3 statements
4. FMCG: the problem statement, four crises, spare cards and ten Round 3 statements
5. Energy: the problem statement, four crises, spare cards and ten Round 3 statements
6. Aviation (extra sector): the problem statement, four crises, spare cards and ten Round 3 statements
7. Fintech (extra sector): the problem statement, four crises, spare cards and ten Round 3 statements
8. Appendix A · How every answer is judged (the rubrics)
9. Appendix B · Organiser checklist

1 · How the night uses them

PRIMUS has three tracks. **Product** teams build a startup inside their sector and run it as a listed company. **Consulting** teams are firms that companies hire for advice. **Finance** teams are funds that invest in the companies and trade their shares. At the squad draw the lottery gives every squad one of the three sectors, in equal shares (17 Luxury, 17 FMCG and 16 Energy for 50 squads), and the squad keeps that sector all night.

Sections 6 and 7 add two extra sectors, **Aviation** and **Fintech**, with the same parts. They are not in the three-sector files uploaded today, but they are ready to play: the platform takes 2 to 6 sectors, **seed/sectors/all** holds all five (10 squads each), and **pnpm sectors --pick Luxury,FMCG,Aviation** writes the three upload files for any mix, for example Aviation instead of Energy.

Time	Round	What happens	What it moves
21:00	Squad draw	Each squad's sector is drawn and its problem card is set.	Who competes with whom all night
21:00–22:00	Round 1 · Foundation	**Product** writes a PRD for a startup inside its sector's problem statement (800 words, 7 sections). **Consulting** writes a memo on the Kaveri Fresh case (500 words, 6 sections).	The PRD score sets the IPO price; the memo score sets the firm's opening reputation and a bonus
by 22:30	Round 1	**Consulting** makes Call 1: BUY or SELL on each of its two companies. **Finance** reads the PRDs and bids in the IPO (until 22:45).	$2,500 per correct call; the opening share register
22:45 · 00:15 · 01:45 · 03:15	Round 2 · Pressure	Four crises. In crisis *k* every company gets its own sector's card number *k*: 1 Operations, 2 Market, 3 Trust, 4 Money.	Every price −5% at each reveal; then each plan's score moves its company's price
04:45	Round 3 · Saturation	Funds receive fresh capital. Companies draft one of their sector's ten statements and write a solution with a hired firm (600 words, 6 sections).	The solution score moves the price, shared between companies on the same statement
06:00 · 06:30 · 07:10	Close	Solutions due; the market closes; the awards.	Final rankings

One crisis, minute by minute

Minute	What happens
0	The crisis cards are revealed, one to each company (its sector's card *k*). Every price falls 5% and trading pauses for 5 minutes.
0–20	**Hiring.** The Product team sends offers (cash, shares or both) to consulting firms; firms accept, counter or decline. One firm per company, at most two clients per firm. Open offers lapse at minute 20.
20–65	**Writing.** The Product team writes its crisis plan (500 words, 7 sections); the hired firm writes its advice memo to the client (500 words, 4 sections). Both close at minute 65. The fee, held in escrow, is paid to the firm if its memo is in, and refunded otherwise.
65–80	**Rating.** The client rates its firm from 1 to 5 stars (a missing rating counts as 3). Plans are public; scores stay sealed.
80	**Release.** The plan's score moves the company's price. The firm earns a reputation bonus of $500 × (memo score − 50) + $1,000 × (stars − 3).
80–90	**Last trading window** of the crisis. It opens only once the plan scores are released.

Round 3 in short

The statements	Ten per sector, each open to at most 5 companies (room for 50 in every sector).
The draft	The lowest score so far (the PRD and the Round 2 plans, averaged) picks first, 20 seconds each, and only from its own sector's statements. A company that does not pick gets the least-crowded open statement.
Hiring	Firms post an asking fee; offers must be 5–20% of the company's cash; at most 3 counters; 2 clients per firm.
Saturation	On each statement, companies are ranked by score: the 1st gets its full price rise, the 2nd ×0.75, the 3rd ×0.5, the 4th and 5th ×0.25. Price falls apply in full. A company alone on its statement gets its full rise.

2 · Round 1 · The consulting case: Kaveri Fresh

Every Consulting firm, whatever its squad's sector, writes a recommendation memo on this one case, by 22:00. Because the case is the same for everyone, the memo score is a fair first measure of each firm, and it sets the reputation companies see when they hire in Round 2.

ON SCREEN · THE CASE

Kaveri Fresh: the cold room is gone

Kaveri Fresh is a Bengaluru start-up that delivers fruit and vegetables from 40 farms to 220 restaurants. It has 35 staff, ₹1.2 crore in the bank and makes ₹18 lakh a month in gross profit on ₹1.5 crore of sales. On Monday its only cold-storage partner, which holds 60% of its stock overnight, shut without notice after a fire. Kaveri has no other cold room. Without one it can keep only a day's stock in its six refrigerated vans, and about a third of what it buys spoils. Two of its five largest customers, who together bring 30% of sales, say they will switch suppliers if deliveries are late for a second week. A new cold room of its own would cost ₹45 lakh and take three months to build; renting space elsewhere costs about twice the old rate and the nearest site is 25 km further from the city. The founders want one recommendation by Friday.

The facts at a glance

The business	Bengaluru start-up delivering fruit and vegetables from 40 farms to 220 restaurants; 35 staff.
Money	₹1.2 crore in the bank; ₹18 lakh a month gross profit on ₹1.5 crore of sales.
What happened	On Monday its only cold-storage partner, holding 60% of its stock overnight, shut after a fire.
Without a cold room	Only a day's stock fits in its six refrigerated vans, and about a third of what it buys spoils.
Customers at risk	Two of its five largest customers, 30% of sales together, will switch if deliveries are late a second week.
Options in the case	Its own cold room: ₹45 lakh and three months to build. Rented space: about twice the old rate, and 25 km further from the city.
Deadline	The founders want one recommendation by Friday.

The memo (500 words) has six sections: diagnosis · options and trade-offs · recommendation · the numbers · risks · next steps. The judge scores them out of 25, 20, 20, 15, 10 and 10 (Appendix A).

What a strong memo does

- **Diagnosis:** names the root cause (one storage partner and no backup) and what it costs each week: the spoilage, and the two customers bringing 30% of sales, about ₹45 lakh of a ₹1.5 crore month.
- **Options:** compares at least two options on cost, time and risk, and pairs a short-term bridge (this week) with the long-term fix (the next three months).
- **Recommendation:** makes one clear choice that follows from the analysis, and says what it gives up and why that is acceptable.
- **Numbers:** works out the costs and the money at risk correctly, and checks that the plan fits ₹1.2 crore of cash.
- **Risks and next steps:** a plan for each main risk, and this week's actions with owners and dates.

The standard is what a strong student team can write in under an hour.

SECTION 3 · SECTOR

Luxury

Reengineering the next era of luxury · problem card 1 of 3 · about 17 squads of 50

Luxury is moving beyond owning rare products towards personalised services, experiences, access and proof of authenticity. The sector's value rests on desirability and trust, so counterfeits, scandals, a generation's changing tastes or an economic downturn hit valuations hard. That makes luxury a natural test of brand judgement for Consulting firms and of conviction for Finance teams.

Round 1 · The problem statement

ON SCREEN · PROBLEM CARD 1

Reengineering the next era of luxury

The global luxury ecosystem is undergoing a fundamental transformation, moving beyond conventional paradigms of ownership, exclusivity and status towards hyper-personalisation, intelligent services and immersive experiences. Despite rapid market evolution, significant gaps persist in how luxury is conceptualised, delivered, accessed and sustained. From fragmented consumer journeys and underdeveloped experiential ecosystems to inefficient service infrastructure and evolving expectations of affluent consumers, the industry presents substantial opportunities for disruption. How might we leverage emerging business models, technological innovation and unconventional value propositions to architect the next generation of luxury products, services and experiences, transforming premium living into an entirely new market opportunity?

Every Product team in this sector invents its own startup inside this statement and describes it in its PRD (800 words, 7 sections: problem and target user, proposed solution, core features and MVP scope, success metrics, business model, competitive edge, key risks).

Opportunity areas

A · Experiences and hospitality

- Hyper-personalised luxury travel and hospitality
- Exclusive, curated experiences and private memberships
- Luxury concierge and lifestyle management platforms
- Immersive hospitality and destination-based experiences
- Personalised premium wellness and leisure services

B · Intelligent luxury and personalisation

- AI-powered personal shopping assistants
- Predictive consumer preference platforms
- Bespoke product customisation and manufacturing
- Intelligent wardrobe and lifestyle management
- Personalised luxury recommendations and discovery

C · Ownership and accessibility

- Alternative ownership and fractional luxury models
- Premium asset-sharing ecosystems
- Verified luxury resale and authentication platforms
- Subscription-based access to premium products
- Luxury rental and circular ownership models

D · Infrastructure and services

- Smart luxury residences and intelligent living spaces
- Integrated property and lifestyle management
- Automated premium customer service infrastructure
- Exclusive mobility and transportation services
- Digital ecosystems connecting luxury service providers

E · Sustainability and responsible luxury

- Sustainable luxury material innovation
- Product lifecycle and traceability solutions

F · Brand innovation and engagement

- Next-generation luxury loyalty ecosystems
- Digital identity and authenticity verification

- Premium repair, restoration and refurbishment services
- Circular luxury commerce
- Ethical sourcing and supply-chain transparency
- Experiential brand engagement platforms
- New-age luxury communities and private networks
- Innovative brand extension and monetisation models

Real-world challenges

Challenge	Why it matters
The exclusivity dilemma	Expanding the customer base without diluting scarcity, prestige and brand equity.
The personalisation gap	Experiences are fragmented across stores, apps, hotels and personal services instead of one intelligent, personal ecosystem.
The authenticity crisis	Sophisticated counterfeits and a growing resale market undermine provenance and confidence.
The ownership paradigm shift	Access, flexibility, experiences and sharing challenge the model of owning products.
The after-sales deficit	Repair, warranty, maintenance and restoration are fragmented and inconsistent.
The brand extension dilemma	Moving into hospitality, wellness or real estate risks complexity and dilution.
The sustainability paradox	Premium, resource-heavy production must meet ethical sourcing and circular expectations.

Startups for inspiration

- Aura Blockchain Consortium: Digital certificates of authenticity and ownership for luxury goods.
- Vestiaire Collective / The RealReal: Authenticated luxury resale.
- Rent the Runway: Subscription and rental access to designer fashion.
- Quintessentially: Members-only lifestyle concierge.
- Kapture-style clienteling tools: Software that lets luxury stores know and serve each client personally.

Named for inspiration only: teams must not copy them, and the judge scores the team's own plan.

An illustrative concept: LUXORA. The operating system for luxury living: one digital ecosystem that connects affluent consumers with personalised lifestyle services, premium experiences, exclusive memberships, luxury property management, private travel and concierge services, and anticipates their preferences instead of making them deal with many separate providers. This is one interpretation; other teams could build luxury hardware, sustainable materials, premium hospitality, authentication technology or new ownership models.
How it could make money: Premium annual memberships; commission-based service partnerships; exclusive brand collaborations; B2B partnerships with luxury hospitality and real estate companies; personalised concierge subscriptions.

What a strong PRD shows in this sector

- The client segment (new-money professionals, NRIs, the ultra-rich, aspirational buyers) and what they lack today
- Why it is luxury: scarcity, craft, service or access, not just a higher price
- How trust is earned: authentication, privacy, service quality
- Unit economics per member, item or experience
- Success metrics such as members retained, spend per client, resale value kept or authentication accuracy

Round 2 · The four crisis cards

In crisis *k*, every Luxury company receives card *k* below, so all of them face the same numbers and can be compared fairly. The plan (500 words) is due 65 minutes after the reveal.

1 OPERATIONS The digital identity breach

ON SCREEN

> A premium lifestyle platform you depend on is breached: the purchase histories and private profiles of 40,000 high-net-worth clients leak. Several cancel their memberships and the press names your brand.
>
> The twist: The hackers email 300 of your top clients offering to delete their data for a fee, and two of them ask you to pay it.
>
> Your plan must decide: Pay, refuse, or call the police, and what you say to the 300 within 24 hours.

ON THE CARD

- 40,000 high-net-worth clients' profiles and purchase histories leaked
- The breach is at a partner platform, but the press names your brand
- Members are already cancelling

WHAT IT DOES TO THE COMPANY

Discretion is part of what luxury clients pay for, so a leak hits trust, retention and the brand's name at once, and it exposes how much the company depends on an outside platform.

THE HIRED FIRM'S ADVICE SHOULD

Separate what the company controls (its own data, its words, its service) from what it does not (the partner's systems); set the order of the first 72 hours; price retention offers against what a top client is worth.

A STRONG CRISIS PLAN

- Protect clients first: tell the people affected, secure their accounts, reach out personally to the most valuable
- Rebuild confidentiality: what data the company holds, who can see it, what changes now
- Reduce dependence on the breached platform, and cost the switch
- Estimate the revenue at risk (memberships cancelled and spending lost) against the cost of the response

WHAT FUNDS WILL WATCH

How many members cancel and how many stay, how fast and how honestly the company responds, and its dependence on outside platforms.

2 MARKET The experience economy disruption

ON SCREEN

> A disruptive startup offers ultra-personalised premium experiences without ownership. 20% of your clients shift spending to it within a quarter and engagement with your products falls.
>
> The twist: The rival offers your three best artisans double pay to design for it. One has already said yes.
>
> Your plan must decide: Match the offer, let them go, or partner with the rival, with the cost of each.

ON THE CARD

- A startup sells ultra-personalised experiences without ownership
- 20% of your clients move spending to it within a quarter
- Engagement with your products falls

WHAT IT DOES TO THE COMPANY

Revenue from a fifth of clients is at risk and the shift may spread; the company has to decide whether it sells products, access or experiences.

A STRONG CRISIS PLAN

- Decide between partnering with, acquiring, copying or differentiating from the rival
- Add experiences only where they fit the brand
- Show the value of each option: revenue kept or won against what it costs
- Say how you will know within weeks whether the clients are coming back

THE HIRED FIRM'S ADVICE SHOULD

Find out which clients left and why; test one experience offer quickly before a big bet; protect what the rival cannot copy, such as craft, heritage and personal service.

WHAT FUNDS WILL WATCH

Whether the lost clients return, what the new offer costs, and whether the brand stays premium.

3 TRUST The counterfeit revolution

ON SCREEN

> Hyper-realistic counterfeits made with advanced manufacturing flood the market. Even experts cannot tell them apart; resale prices of authentic pieces fall 30% and returns from buyers who fear fakes rise 4×.
>
> The twist: A celebrity posts that her bag from you is a fake. It is genuine, but the post has 2 million likes.
>
> Your plan must decide: Prove it publicly or settle it privately, and how you protect every other client's trust.

ON THE CARD

- Hyper-realistic counterfeits that even experts cannot tell apart
- Resale prices of authentic pieces fall 30%
- Returns from buyers who fear fakes rise 4×

WHAT IT DOES TO THE COMPANY

Resale value supports the price new buyers will pay; when nobody can prove what is genuine, both the resale market and new sales suffer.

A STRONG CRISIS PLAN

- Prove authenticity: digital IDs, verified resale, guarantees
- Handle the returns now and reassure existing clients
- Protect resale value of genuine pieces
- Cost the programme against the sales at risk

THE HIRED FIRM'S ADVICE SHOULD

Choose a verification method clients will trust and that can be rolled out quickly; decide who pays for it; set a fair returns policy for the buyers who are worried today.

WHAT FUNDS WILL WATCH

Resale prices and return rates after the response, and the cost and speed of the authentication rollout.

4 MONEY The luxury market crash

ON SCREEN

> A sudden downturn cuts discretionary spending: luxury retail falls 18%, high-end hospitality bookings 25% and luxury real estate deals 30%. Your next funding round is postponed.
>
> The twist: Your largest investor asks you to cut prices 20% to keep sales up. Your brand team says that would end the brand.
>
> Your plan must decide: Discount, hold prices and cut costs, or launch something cheaper under another name. Show the runway.

ON THE CARD

- Luxury retail falls 18%
- High-end hospitality bookings fall 25%
- Luxury real estate deals fall 30%
- Your next funding round is postponed

WHAT IT DOES TO THE COMPANY

Revenue falls just as outside money stops, so the cash runway becomes the main constraint.

A STRONG CRISIS PLAN

- Protect cash without discounting the brand
- Focus on the most loyal clients and delay expansion
- Find revenue that holds up in a downturn (services, maintenance, top clients)
- Show the runway in months under the card's falls

THE HIRED FIRM'S ADVICE SHOULD

Model the runway with the card's numbers; rank cost cuts by how much they damage the brand; name the revenue that survives a downturn.

WHAT FUNDS WILL WATCH

Months of runway, whether the company discounts (which damages the brand) or holds its prices, and how many top clients it keeps.

Spare cards

Not loaded in the game. Use one to replace a card before the draw, in a rehearsal, or as a mid-round surprise announced in a bulletin.

- The sustainability scandal: a report exposes unethical sourcing and excessive resource use across several high-end brands, including one of your suppliers
- The next-gen exodus: research shows younger affluent buyers moving to niche labels and independent creators; your under-35 sales fall 22%
- Mid-round surprise: a company that looked safe is itself put under investigation for counterfeit components
- An influencer you paid is exposed for fake reviews
- A 20% rise in import duty on luxury goods

Round 3 · The ten problem statements

Each statement takes at most 5 companies. A Luxury company drafts only from this list, and writes its solution (600 words, 6 sections: our solution, why it fits the statement, how we stand apart, how we will build it, business impact, risks) with the firm it hires. The game shows each statement as its title and a client brief: who it is for, the numbers, the catch and what winning looks like.

#	Statement (on screen)	A strong solution shows
1	**Expand to new clients without losing exclusivity** **Who it is for:** A heritage watchmaker whose clients are mostly over 55. **The numbers:** Its clients spend Rs 12 lakh a year on average; it wins only 300 new ones a year. **The catch:** Every new client must feel as exclusive as the old ones; one mass campaign could undo 40 years of the brand. **You win if:** 1,000 new clients in a year with no fall in the average price paid. Up to 5 companies	Who the new clients are, how access stays scarce (invitations, limits, tiers), and how you measure that existing clients do not leave or spend less.
2	**One personal assistant for a client's whole luxury life** **Who it is for:** A family that spends on travel, fashion, art and cars through 20 separate concierges. **The numbers:** They spend about Rs 3 crore a year and lose roughly 40 hours a month to arranging it. **The catch:** They share their data with no one they do not trust completely. **You win if:** One assistant they use every week, and a fee they pay without asking for a discount. Up to 5 companies	Which needs it brings together (travel, shopping, homes, events), how it learns preferences while keeping data private, and what clients pay for it.
3	**Prove any luxury item is genuine in seconds** **Who it is for:** Resale shops and buyers of second-hand luxury bags and watches. **The numbers:** 1 in 8 items offered for resale is fake, and an expert check takes 3 days and costs Rs 4,000. **The catch:** Counterfeits now pass the checks experts use, so a better eye is not enough. **You win if:** A check in under 60 seconds, at under Rs 200, that catches 99% of fakes. Up to 5 companies	How an item is checked at the point of sale or resale, who pays, what happens to items already in circulation, and the error rate you can promise.
4	**Fractional ownership of art, cars or watches** **Who it is for:** Young professionals who earn well but cannot buy a Rs 50 lakh painting or car. **The numbers:** A share can start at Rs 25,000, and a year of ownership must cost less than renting the item. **The catch:** Owners argue about who uses the car, when to sell and who pays for insurance. **You win if:** Shares that sell again within a week at a fair price, with no disputes left open. Up to 5 companies	Which assets, how shares are bought, held and sold, who looks after the asset, and how owners get value from it, within the rules.

#	Statement (on screen)	A strong solution shows
5	**After-sales care as good as the purchase** **Who it is for:** Clients who bought a Rs 5 lakh piece and waited 3 months for a repair. **The numbers:** Repairs take 90 days on average and 30% of clients do not buy again after one. **The catch:** The best craftsmen are few, and are in Europe. **You win if:** Repairs back in under 14 days and clients who buy again more often after a repair than before it. Up to 5 companies	Repair, maintenance and restoration as one service: turnaround times, quality control, and how it keeps clients loyal and spending.
6	**Turn a fashion brand into a hospitality experience** **Who it is for:** A fashion house that wants clients to stay, eat and celebrate inside its world. **The numbers:** A hotel costs Rs 200 crore to build; the brand has Rs 20 crore to spend. **The catch:** Hospitality is a different business, and one bad stay is seen by the whole fashion world. **You win if:** A first experience that sells out and earns money within 12 months. Up to 5 companies	The experience (hotel, club, café, events), how it fits the brand without diluting it, and the economics per guest or member.
7	**Luxury materials that are fully traceable and sustainable** **Who it is for:** Brands that use leather, gold and silk and are asked where they came from. **The numbers:** Under 20% of their materials can be traced to the source today. **The catch:** Suppliers guard their sources, and new materials must still feel luxurious. **You win if:** 80% of materials traced, with proof a client can see on the product. Up to 5 companies	Which material, how every step is traced and proven, the premium clients will pay, and how the claims are checked independently.
8	**Win the next generation of luxury buyers** **Who it is for:** Buyers aged 22 to 30 who prefer experiences, resale and their own feeds to the brand's store. **The numbers:** They will be 40% of luxury buyers by 2030 but are 10% of this brand's sales. **The catch:** What attracts them may put off today's loyal clients. **You win if:** Doubling the brand's sales to buyers under 30 without losing its older clients. Up to 5 companies	Who these buyers are and what they value, the product and channel that reach them, and measures such as first purchases and repeat rate.
9	**Private, secure data for high-net-worth clients** **Who it is for:** Families whose wealth, travel and purchases are tracked by apps, staff and hackers. **The numbers:** One leak can cost a client crores in fraud or kidnap risk. **The catch:** Clients want privacy and the convenience of apps at the same time. **You win if:** A service clients trust with their data, audited by an outside firm, that nobody leaves. Up to 5 companies	What data is protected, how clients control it, how breaches are prevented and handled, and why clients would pay for it.

#	Statement (on screen)	A strong solution shows
10	**Circular luxury: repair, resell and refurbish at scale** **Who it is for:** A luxury group with 50,000 old pieces in its clients' cupboards. **The numbers:** Each piece can be repaired and resold 2 or 3 times; today 5% are. **The catch:** Resale must not make new pieces look cheaper. **You win if:** Resale and repair worth 15% of the group's revenue within 3 years. Up to 5 companies	How items come back, are authenticated, restored and resold; the margin per item; and how it protects the brand's prices.

What Finance teams should watch in this sector

Signal	Why
Brand equity	Pricing power and resale value are the signals.
Client concentration	How much revenue the top clients bring.
Authenticity exposure	Risk from counterfeits and the resale market.
Sensitivity to downturns	Discretionary spending falls first.
Reputation risk	Scandals and breaches travel fast among wealthy clients.

SECTION 4 · SECTOR

FMCG

Fast-moving consumer goods · problem card 2 of 3 · about 17 squads of 50

FMCG covers the everyday products people buy again and again: food, drinks, personal care and household goods. The sector runs on thin margins, huge volumes and long distribution chains that reach millions of small shops. That makes every problem, from spoilt stock to a viral complaint, show up quickly in sales and margins, which is exactly what the game needs.

Round 1 · The problem statement

ON SCREEN · PROBLEM CARD 2

Fast-moving consumer goods

The FMCG industry is undergoing a significant transformation as consumers increasingly demand healthier products, greater transparency, sustainability, personalized experiences, and seamless product availability. However, many companies continue to struggle with understanding rapidly changing consumer preferences, optimizing supply chains, reducing product wastage, ensuring efficient last-mile distribution, and building trust through authentic and transparent practices. Design an innovative startup that addresses one or more of these interconnected challenges to help FMCG businesses become more consumer-centric, operationally efficient, sustainable, and future-ready.

Every Product team in this sector invents its own startup inside this statement and describes it in its PRD (800 words, 7 sections: problem and target user, proposed solution, core features and MVP scope, success metrics, business model, competitive edge, key risks).

Opportunity areas

Demand and retail intelligence

- Forecasting for festivals, seasons and local tastes
- Inventory tools for small retailers and distributors
- Shelf and price analytics for modern trade and quick commerce

Supply chain and last mile

- Cold chain for fresh and frozen food
- Route and fleet optimisation
- Reaching rural shops profitably

Healthier and honest products

- Better-for-you food at mass prices
- Clear labels and ingredient traceability
- Personalised nutrition

Sustainability

- Plastic-free and refill packaging
- Food-waste reduction and recovery
- Traceable, ethical sourcing

Real-world challenges

Challenge	Why it matters
Fast-changing tastes	Preferences shift by city, season and social media trend faster than plants and supply chains can follow.
Waste and spoilage	Perishable stock is lost at every step from farm to shelf, eating into thin margins.
The last mile	Millions of small shops order little and often; serving them profitably is hard.
Trust	Consumers doubt health and sustainability claims, and one viral post can undo years of branding.
Channel dependence	Quick-commerce apps and big retailers control shelf space, data and pricing power.

Startups for inspiration

- Bizom (India): Retail intelligence, inventory optimisation and demand forecasting for fragmented distribution.
- Locus (India): AI logistics and last-mile route optimisation.
- RELEX Solutions: Demand forecasting and inventory optimisation across online and offline channels.
- Licious (India): Fresh food supply chain sold direct to consumers.
- Provenance: Product traceability and sustainability verification.
- Crisp: Retail analytics and consumer insights.

Named for inspiration only: teams must not copy them, and the judge scores the team's own plan.

An illustrative concept: FRESHLOOP. A demand-sensing and redistribution platform for perishable FMCG. It forecasts each shop's sales by day, moves near-expiry stock to shops or channels that will sell it, and donates or recycles what is left.
How it could make money: Software subscription from brands and distributors; a share of the waste saved; data products for retail chains.

What a strong PRD shows in this sector

- A specific user (a brand, a distributor, a shop owner or a shopper) and the pain in numbers
- A first version small enough to launch in one city or one category
- Unit economics: cost and margin per unit, order or shop
- How it reaches shops or shoppers, and who pays
- Success metrics such as waste %, fill rate, repeat purchase or margin

Round 2 · The four crisis cards

In crisis *k*, every FMCG company receives card *k* below, so all of them face the same numbers and can be compared fairly. The plan (500 words) is due 65 minutes after the reveal.

1 OPERATIONS Heatwave breaks the cold chain

ON SCREEN

> A 46°C heatwave hits North India. Your cold chain fails in 3 cities: 18% of this week's stock spoils and 2,400 customers post complaints. Refunds cost Rs 41 lakh.
>
> The twist: The heatwave is forecast to last 10 more days, and a rival offers to rent you its cold storage at 3× the normal rate.
>
> Your plan must decide: Rent it, ration what you sell, or pause the hottest cities, and the cost of each for the 10 days.

ON THE CARD

- A 46°C heatwave in North India
- The cold chain fails in 3 cities
- 18% of this week's stock spoils
- 2,400 customers complain; refunds cost Rs 41 lakh

WHAT IT DOES TO THE COMPANY

A loss this week (stock and refunds) and a hit to reputation, with more hot weeks likely to come.

THE HIRED FIRM'S ADVICE SHOULD

Separate the immediate fix (backup storage, new routes, night deliveries) from the lasting one (a cold chain that survives heat); compare its cost with the Rs 41 lakh already lost.

A STRONG CRISIS PLAN

- Protect the stock that is left first, then the customers
- Decide who gets refunds and how fast
- Change storage and routes so the next heatwave hurts less
- Price the fix against the loss on the card

WHAT FUNDS WILL WATCH

How fast the losses stop, whether complaints fall, and the cost of the fix against the margin.

2 MARKET A giant gives it away free

ON SCREEN

> A quick-commerce giant launches a free version of your core product or service for its partners. 22% of your customers say they will switch within a month.
>
> The twist: The same giant offers to buy your company at your current price. Your investors are split.
>
> Your plan must decide: Sell, partner, or fight, with what each means for customers and the share price.

ON THE CARD

- A quick-commerce giant gives away a free version of your core product or service to its partners
- 22% of your customers say they will switch within a month

WHAT IT DOES TO THE COMPANY

Competition at a price of zero: losing a fifth of customers in a month would hit revenue and the growth story.

A STRONG CRISIS PLAN

- Find what the free version cannot do
- Defend the customers who value that most
- Choose between partnering, narrowing to a niche or competing on price, with the cost of each
- Track how many customers actually leave against the 22% threat

THE HIRED FIRM'S ADVICE SHOULD

Identify the customers most likely to switch and why others would stay; set a ceiling on what retention may cost; consider working with the giant rather than against it.

WHAT FUNDS WILL WATCH

Actual churn against the 22% threat, and the margin after any price response.

3 TRUST Fake sustainability data

ON SCREEN

> A journalist shows that a key supplier faked its 'plastic-free' and 'organic' data, which you printed on your packs. #Greenwashing trends with your name in it.
>
> The twist: You find that a second supplier may also be faking data, but checking it takes 6 weeks.
>
> Your plan must decide: Say so now, or wait until you are sure. Who is told, and when.

ON THE CARD

- A key supplier faked its 'plastic-free' and 'organic' data
- Your packs carry those claims
- #Greenwashing trends with your name in it

WHAT IT DOES TO THE COMPANY

Shoppers and retailers now doubt every claim the company makes; retailers or regulators may act; the supplier has become a liability.

A STRONG CRISIS PLAN

- Own it quickly and say what was wrong
- Pull or relabel the packs that carry false claims
- Verify suppliers independently and show the proof
- Estimate the cost and the sales at risk

THE HIRED FIRM'S ADVICE SHOULD

Get the first statement and its timing right; bring in independent audits; decide what to do with the supplier; rebuild each claim only with proof.

WHAT FUNDS WILL WATCH

The speed and honesty of the response, how retailers react, and the cost of relabelling and audits.

4 MONEY Raw materials up 30%

ON SCREEN

> Palm oil, packaging and fuel costs rise 30% in a quarter. Your gross margin falls from 34% to 21%, and your next funding round is now in doubt.
>
> The twist: Your biggest retailer says it will delist you if your price goes up by more than 5%.
>
> Your plan must decide: Raise prices and risk the retailer, shrink packs, or absorb the cost. Show the margin and cash under your choice.

ON THE CARD

- Palm oil, packaging and fuel costs rise 30% in a quarter
- Gross margin falls from 34% to 21%
- Your next funding round is in doubt

WHAT IT DOES TO THE COMPANY

Over a third of the margin is gone, and with funding in doubt the company must live on its own cash flow.

A STRONG CRISIS PLAN

- Choose between price rises, smaller packs, cheaper inputs and cost cuts
- Say which products to protect and which to cut
- Show the margin you expect after the plan
- Show the cash runway under the chosen plan

THE HIRED FIRM'S ADVICE SHOULD

Test what shoppers will accept (a higher price or a smaller pack); renegotiate or switch inputs; rank products by margin; show the path back towards 34%.

WHAT FUNDS WILL WATCH

The margin after the plan, how many sales the price rise costs, and the runway.

Spare cards

Not loaded in the game. Use one to replace a card before the draw, in a rehearsal, or as a mid-round surprise announced in a bulletin.

- A quick-commerce app changes its ranking algorithm: your products drop off the first screen and sales fall 28%
- A product recall: one batch fails a food-safety test in 2 states
- A cyberattack locks your ordering system for 3 days during peak season
- Privacy rules stop you using purchase data for personalisation
- Your largest enterprise client (34% of revenue) does not renew

Round 3 · The ten problem statements

Each statement takes at most 5 companies. An FMCG company drafts only from this list, and writes its solution (600 words, 6 sections: our solution, why it fits the statement, how we stand apart, how we will build it, business impact, risks) with the firm it hires. The game shows each statement as its title and a client brief: who it is for, the numbers, the catch and what winning looks like.

#	Statement (on screen)	A strong solution shows
11	**Cut fresh-food waste from 9% to 3% across the supply chain** **Who it is for:** A dairy and fresh-produce brand that sells through 30,000 shops. **The numbers:** 9% of its fresh stock is thrown away, worth Rs 60 crore a year. **The catch:** Shops do not share their sales data and have no space for new equipment. **You win if:** Waste at 3% within a year, with shops earning more than before. Up to 5 companies	Where in the chain the waste happens, the tool or process that removes it (forecasting, routing, redistribution), and the saving per tonne or per shop.

#	Statement (on screen)	A strong solution shows
12	**Reach 50,000 rural kirana shops profitably** **Who it is for:** A biscuit and soap company that sells in cities but hardly reaches villages. **The numbers:** A rural kirana orders Rs 2,000 a week, and each delivery costs Rs 300. **The catch:** Roads, cash payments and tiny orders make every visit expensive. **You win if:** 50,000 shops served at a profit on every order within 18 months. Up to 5 companies	The ordering and delivery model, the cost per drop against the order size, how shops pay, and how you reach the first 1,000 shops.
13	**Plastic-free packaging that costs under Rs 1 more per pack** **Who it is for:** A snacks brand selling 2 crore packs a month. **The numbers:** Plastic packaging costs Rs 1.20 a pack; the alternatives cost Rs 3 or more. **The catch:** Food must stay fresh for 6 months in hot, humid shops. **You win if:** Plastic-free packs at under Rs 2.20 a pack with the same shelf life. Up to 5 companies	The material, its cost per pack at scale, shelf life and supply, and the proof that it is plastic-free.
14	**Honest health labels shoppers actually read** **Who it is for:** Shoppers who spend 4 seconds choosing a pack of noodles. **The numbers:** Under 10% read the label, and most claims on the front are vague. **The catch:** Brands fear honest labels will hurt sales. **You win if:** A label that changes what at least 1 shopper in 5 buys, with sales held. Up to 5 companies	The label or tool, how claims are checked, and evidence that shoppers notice it and change what they buy.
15	**Forecast festival demand within 10% across city types** **Who it is for:** A sweets and snacks brand planning Diwali. **The numbers:** Last year it overstocked metros by 40% and ran out in small towns, a Rs 3.2 crore loss. **The catch:** Every city and town celebrates differently, and data from small shops is thin. **You win if:** A forecast within 10% in every city type, tested on last year's festival. Up to 5 companies	The data used (sales, retailer orders, weather, local events), how accuracy is measured and improved, and what better forecasts save.
16	**Win shelf space on quick-commerce apps against big brands** **Who it is for:** A new healthy-food brand on quick-commerce apps. **The numbers:** The top 3 brands take 80% of the first screen, and paying for placement costs 25% of sales. **The catch:** The apps own the customer data and change their rankings often. **You win if:** First-screen placement in 3 cities while spending under 10% of sales on it. Up to 5 companies	How a smaller brand gets ranked and stocked, what it offers the app, and the cost of each order won.

#	Statement (on screen)	A strong solution shows
17	**Make healthy snacks affordable under Rs 20** **Who it is for:** Students and workers who buy snacks at Rs 10 to Rs 20. **The numbers:** Healthy snacks today cost Rs 50 or more. **The catch:** Better ingredients cost more, and cheap healthy snacks often taste worse. **You win if:** A healthy snack at Rs 20 that sells 1 lakh packs a month and earns a margin. Up to 5 companies	The product, its cost and margin at Rs 20 or less per pack, and how it reaches mass-market shops.
18	**Trace every ingredient from farm to pack in seconds** **Who it is for:** A spice and tea company with 4,000 farmers. **The numbers:** Tracing a single ingredient today takes 3 weeks and a phone call to each supplier. **The catch:** Farmers have basic phones, and middlemen do not want to be seen. **You win if:** Every pack traceable to its farms in under 10 seconds. Up to 5 companies	How data is captured at each step, who enters it, how it is verified, and what brands and shoppers see.
19	**Return and refill systems for household products** **Who it is for:** City households that buy detergent, shampoo and oil in plastic bottles. **The numbers:** A family throws away about 150 bottles a year. **The catch:** Refills must be no harder and no dearer than buying a new bottle. **You win if:** 20,000 households refilling every month and 30% less plastic sold. Up to 5 companies	How containers come back and are refilled, the cost per refill against a new pack, and the return rate needed to break even.
20	**Personalised nutrition for India's diabetic population** **Who it is for:** Some of India's 10 crore people with diabetes, and their families. **The numbers:** Most see a doctor twice a year and get the same generic diet chart. **The catch:** Food is cultural, budgets are tight, and nobody wants to feel ill. **You win if:** Members whose blood sugar improves measurably within 6 months, at under Rs 500 a month. Up to 5 companies	Who the users are, how advice or products are personalised, how outcomes are tracked safely, and who pays.

What Finance teams should watch in this sector

Signal	Why
Margin per unit	Does the plan protect it after a cost shock?
Wastage %	A falling number is a strong buy signal.
Acquisition cost vs repeat rate	Repeat buyers make FMCG profitable.
Channel dependence	One app or retailer holding most sales is a risk.
Cash runway	Months of cash left at the current burn.

SECTION 5 · SECTOR

Energy

Clean energy and power · problem card 3 of 3 · about 16 squads of 50

India must add a great deal of power capacity this decade while cutting emissions. Rooftop solar, EV charging, batteries and smart grids are growing fast, but they depend on subsidies, imported hardware and a grid that struggles at peak times. Policy changes and price swings hit these businesses hard and visibly, which gives funds clear signals to trade on.

Round 1 · The problem statement

ON SCREEN · PROBLEM CARD 3

Clean energy and power

The energy transition is reshaping how power is produced, stored, distributed and used. Rooftop solar, electric mobility, batteries and smart grids are growing fast, yet customers find clean energy costly and confusing, grids struggle with peak demand and outages, hardware supply chains are fragile, and businesses cannot measure or reduce their emissions with confidence. Design an innovative startup that makes clean energy cheaper, more reliable, easier to adopt or easier to measure, for homes, businesses, farms or cities, while remaining commercially viable without permanent subsidies.

Every Product team in this sector invents its own startup inside this statement and describes it in its PRD (800 words, 7 sections: problem and target user, proposed solution, core features and MVP scope, success metrics, business model, competitive edge, key risks).

Opportunity areas

Generation and storage

- Rooftop and community solar
- Batteries suited to Indian heat
- Storage for farms and cold chains

Electric mobility

- Charging networks for cities and highways
- Battery swapping for two- and three-wheelers
- Fleet electrification for delivery companies

Grid and demand

- Peak-demand reduction and smart tariffs
- Paying consumers to save or shift power
- Microgrids for villages and campuses

Carbon and circularity

- Carbon accounting for small factories
- Recycling batteries and panels
- Green power for data centres and industry

Real-world challenges

Challenge	Why it matters
Upfront cost	Clean energy saves money over years but costs a lot on day one.
Subsidy dependence	Many business cases work only while subsidies last.
Hardware supply	Panels, cells and chips are largely imported and swing in price.
Reliability	Heat, dust and grid outages shorten equipment life and break promises to customers.
Safety and trust	Battery fires and installer quality problems make customers wary.

Startups for inspiration

- SolarSquare (India): Rooftop solar for homes on easy monthly payments.
- Statiq (India): EV charging network for cities and highways.
- Log9 Materials (India): Fast-charging batteries for Indian conditions.

- Octopus Energy (UK): Software-led energy retail with smart tariffs.
- Sinai Technologies: Carbon accounting for industry.

Named for inspiration only: teams must not copy them, and the judge scores the team's own plan.

An illustrative concept: SUNSHARE. Community solar for apartment blocks and renters. Residents buy shares of a shared rooftop or nearby plant through an app and see the savings on their power bill.
How it could make money: A margin on each share sold; a monthly service fee; selling surplus power to the grid.

What a strong PRD shows in this sector

- Who adopts it and what they pay today for power, fuel or carbon
- The payback period with and without subsidies
- How the hardware is sourced, installed and maintained
- Safety and reliability in Indian conditions
- Success metrics such as cost per unit of power, uptime or tonnes of carbon saved

Round 2 · The four crisis cards

In crisis *k*, every Energy company receives card *k* below, so all of them face the same numbers and can be compared fairly. The plan (500 words) is due 65 minutes after the reveal.

1 OPERATIONS Grid blackout in peak summer

ON SCREEN

> A 9-hour blackout across 4 states. Your systems or stations go offline, 30% of customers miss service, and penalty clauses cost Rs 55 lakh.
>
> The twist: A second blackout is likely within the week, and a minister blames 'private operators' on live TV.
>
> Your plan must decide: Who you protect first (hospitals, paying customers, or the grid operator), and what you tell the public.

ON THE CARD

- A 9-hour blackout across 4 states
- Your systems or stations go offline
- 30% of customers miss service
- Penalty clauses cost Rs 55 lakh

WHAT IT DOES TO THE COMPANY

Penalties now, and the promise of reliable power is broken in front of customers.

THE HIRED FIRM'S ADVICE SHOULD

Set the order of restoration; handle the penalty clauses (credits, renegotiation); weigh the cost of backup against the expected cost of future outages.

A STRONG CRISIS PLAN

- Restore service in order of customer impact
- Communicate clearly during and after the outage
- Design backup or islanding so the next blackout hurts less
- Cost the backup against the penalties and lost customers

WHAT FUNDS WILL WATCH

Penalties paid, customers lost, and what the backup investment costs.

2 MARKET Cheap imports flood the market

ON SCREEN

> Solar panels and batteries from abroad drop 25% in price. Your hardware now costs more than rivals' and two big orders are cancelled.
>
> The twist: An importer offers to supply you at their low price if you put your brand on their hardware.
>
> Your plan must decide: Rebrand imports, cut your own costs, or compete on service and warranty. Show the margin of each.

ON THE CARD

- Imported solar panels and batteries drop 25% in price
- Your hardware now costs more than rivals'
- Two big orders are cancelled

WHAT IT DOES TO THE COMPANY

The hardware margin and the order book are hit together, and competing on price alone may not work.

A STRONG CRISIS PLAN

- Compete where imports are weak: service, warranty, financing, installation quality
- Or change suppliers, and say what that does to quality and margin
- Try to win back the cancelled orders
- Show the new margin

THE HIRED FIRM'S ADVICE SHOULD

Decide between switching to imported components and moving up to services; say what would win back the two orders; work out the new unit economics.

WHAT FUNDS WILL WATCH

The margin after the response, and whether the order book recovers.

3 TRUST A battery fire goes viral

ON SCREEN

> A video of a battery fire at a customer site gets 4 million views. The fire was not proven to be yours, but bookings fall 40% and a regulator asks for safety data.
>
> The twist: The regulator gives you 72 hours to share your safety data, and your own data shows one near-miss you never reported.
>
> Your plan must decide: Disclose the near-miss or not, and how you rebuild trust with customers who are scared.

ON THE CARD

- A battery-fire video at a customer site gets 4 million views
- The fire was not proven to be yours
- Bookings fall 40%
- A regulator asks for safety data

WHAT IT DOES TO THE COMPANY

Fear spreads faster than facts: sales drop and the regulator starts asking questions.

A STRONG CRISIS PLAN

- Be transparent, and cooperate with the regulator
- Publish safety evidence
- Offer free inspections to customers
- Estimate the cost of rebuilding bookings

THE HIRED FIRM'S ADVICE SHOULD

Say what to state (and not to state) before the facts are known; commission an independent safety review; choose reassurance that customers value; cost it all.

WHAT FUNDS WILL WATCH

Whether bookings recover, the regulator's response, and the cost of inspections.

4 MONEY Subsidy cut overnight

ON SCREEN

> The government cuts the subsidy your customers rely on from Rs 30,000 to Rs 10,000. Your payback pitch of 4 years becomes 6.5 years.
>
> The twist: A state government offers its own subsidy, but only if you build a factory in that state within 2 years.
>
> Your plan must decide: Take the deal, change the business model, or sell to customers who do not need the subsidy. Show the payback.

ON THE CARD

- The subsidy your customers rely on falls from Rs 30,000 to Rs 10,000
- Your payback pitch of 4 years becomes 6.5 years

WHAT IT DOES TO THE COMPANY

The main selling point, the payback period, gets much worse overnight; demand falls; the business case leaned on policy.

A STRONG CRISIS PLAN

- Rebuild the offer without the subsidy
- Options: financing, smaller systems, a new customer segment
- Show the payback customers will now see
- Show the runway

THE HIRED FIRM'S ADVICE SHOULD

Work out the customer's payback under each option (financing, a smaller system, business customers); name the segment that still buys; show the runway.

WHAT FUNDS WILL WATCH

How much of the business depends on subsidies, the new payback offered, and orders after the cut.

Spare cards

Not loaded in the game. Use one to replace a card before the draw, in a rehearsal, or as a mid-round surprise announced in a bulletin.

- A lithium price spike raises battery costs 40%
- A new rule requires local manufacturing for subsidy eligibility
- A cyberattack takes over smart meters in one city
- Your main installer partner goes bankrupt
- A heatwave cuts panel output 15% for a month

Round 3 · The ten problem statements

Each statement takes at most 5 companies. An Energy company drafts only from this list, and writes its solution (600 words, 6 sections: our solution, why it fits the statement, how we stand apart, how we will build it, business impact, risks) with the firm it hires. The game shows each statement as its title and a client brief: who it is for, the numbers, the catch and what winning looks like.

#	Statement (on screen)	A strong solution shows
21	**Rooftop solar for renters and apartment blocks** **Who it is for:** Renters and apartment residents who cannot put panels on a roof they do not own. **The numbers:** Half of city homes are rented or in tall blocks. **The catch:** Owners, residents' associations and the power company must all agree. **You win if:** 500 flats on solar in a year, with tenants saving 20% on their bills. Up to 5 companies	How residents who do not own the roof take part, how savings are shared and billed, and the payback for each resident.

#	Statement (on screen)	A strong solution shows
22	**EV charging on highways that pays for itself in 3 years** **Who it is for:** Highway charging-station investors. **The numbers:** A fast charger costs Rs 40 lakh and sees only 6 cars a day today. **The catch:** Highway traffic is seasonal and EV numbers are still small. **You win if:** A site that pays back in 3 years with today's traffic. Up to 5 companies	Where the chargers go and why, the cost per charger, the use needed for a 3-year payback, and every revenue stream.
23	**Batteries that survive Indian summers for 10 years** **Who it is for:** Home and shop battery owners in North India. **The numbers:** Batteries lose half their life in 45°C heat. **The catch:** Cooling uses the power the battery is meant to save. **You win if:** Batteries that keep 80% of their capacity after 10 hot summers, at no more than 15% extra cost. Up to 5 companies	The chemistry or cooling design, the testing that proves it, the warranty you can offer, and the cost per kWh over the battery's life.
24	**Carbon tracking a small factory can afford** **Who it is for:** Small factories that export to Europe and must report their carbon. **The numbers:** A carbon audit costs Rs 5 lakh; most factories earn Rs 2 crore a year. **The catch:** Factory owners have no data team and do not trust software. **You win if:** A report that buyers accept, for under Rs 25,000 a year. Up to 5 companies	What it measures and how, the monthly price a small factory can pay, and how tracking turns into savings.
25	**Cutting peak-hour demand without blackouts** **Who it is for:** A city power company that buys expensive power at 7 pm every summer evening. **The numbers:** Peak power costs 4× normal, and a 10% cut would avoid blackouts. **The catch:** Nobody wants to be told when to use their AC. **You win if:** Peak demand down 10% with no blackouts and no forced switch-offs. Up to 5 companies	How demand is moved or reduced at peak (tariffs, storage, smart devices), who is paid for it, and how much peak demand it removes.
26	**Clean cooking for 20 crore rural homes** **Who it is for:** Rural homes still cooking on wood and dung. **The numbers:** Smoke from cooking harms health in millions of homes; an LPG refill costs a week's income. **The catch:** Families go back to wood when gas runs out or gets dear. **You win if:** 10,000 homes cooking clean every day after a year, not only on day one. Up to 5 companies	The stove or fuel, its price and running cost against today's fuel, how it reaches villages, and how families keep using it.

#	Statement (on screen)	A strong solution shows
27	**Recycling used EV and solar batteries** **Who it is for:** Owners of used EV batteries and old solar panels. **The numbers:** 1 lakh tonnes of batteries will retire each year by 2030; under 10% are recycled properly. **The catch:** Informal recyclers pay more and pollute. **You win if:** A recycling route that pays owners as much as the informal trade and recovers 90% of the metals. Up to 5 companies	How batteries are collected, tested and recycled or reused, the value recovered per battery, and how they are handled safely.
28	**Green power for cold storage on farms** **Who it is for:** Farmers' cooperatives that store fruit and vegetables. **The numbers:** Up to 30% of produce rots for lack of cold storage; diesel cold rooms cost Rs 1,500 a day to run. **The catch:** Villages have power for only part of the day. **You win if:** Cold storage running on clean power at half the cost of diesel. Up to 5 companies	The power system (solar, storage), the cold storage it runs, the cost per farmer, and the produce it saves from spoiling.
29	**Paying households for power they save** **Who it is for:** Households on a city power network. **The numbers:** The power company pays Rs 12 for a unit at peak and sells it to homes at Rs 7. **The catch:** Saving must be easy and the payment worth noticing. **You win if:** 50,000 homes paid every month, with savings the power company can measure. Up to 5 companies	How savings are measured, how households are paid and by whom, and why the grid or the utility gains from it.
30	**Clean energy for 24/7 data centres** **Who it is for:** Data-centre operators that promise clients clean power at every hour. **The numbers:** Solar covers the day; nights and cloudy weeks still run on coal. **The catch:** Storage for every hour is very expensive. **You win if:** 90% clean power around the clock at a price clients accept. Up to 5 companies	How the power stays clean around the clock (storage, contracts, the mix), the cost per unit against grid power, and the proof behind the carbon claims.

What Finance teams should watch in this sector

Signal	Why
Subsidy dependence	How much of the business case survives a policy change.
Payback period	What customers are promised, and whether it holds.
Hardware cost vs imports	Exposure to global price swings.
Safety record	One incident can stop sales.
Debt and runway	Energy projects borrow heavily.

SECTION 6 · EXTRA SECTOR

Aviation

Reimagining the future of aviation · ready to play: seed/sectors/all, or pnpm sectors for any mix

Aviation is far more than airlines: airports, ground handling, maintenance, cargo, drones, air taxis and the passenger journey from door to door. Airlines need huge capital, so this brief asks teams for an MVP anywhere in that wider value chain. Fuel prices, safety incidents and regulators move these businesses sharply, which suits the game.

Round 1 · The problem statement

CARD TEXT · EXTRA SECTOR

Reimagining the future of aviation

The global aviation industry is undergoing a fundamental transformation, with rising operational complexities, evolving passenger expectations, infrastructure constraints and growing sustainability concerns challenging traditional business models. From inefficiencies across airport operations and fragmented passenger experiences to gaps in accessibility, resource utilisation and emerging aviation services, the industry presents significant opportunities for innovation. Your challenge: identify an untapped opportunity or an existing inefficiency within the aviation ecosystem and develop an innovative product, service or business solution that redefines how the industry operates, serves its customers or creates value. Your solution may address any part of the aviation value chain, including passenger experience, airport infrastructure, airline operations, logistics, sustainability, aviation technology or emerging mobility models. Think beyond conventional aviation solutions. Objective: build an MVP that addresses a meaningful industry gap while demonstrating a clear value proposition, target market and potential for real-world adoption. How might we leverage disruptive innovation, emerging business models and unconventional solutions to redefine aviation, unlock untapped market opportunities and engineer the next generation of air travel?

Every Product team in this sector invents its own startup inside this statement and describes it in its PRD (800 words, 7 sections: problem and target user, proposed solution, core features and MVP scope, success metrics, business model, competitive edge, key risks).

Opportunity areas

Passenger experience

- Faster security, check-in and boarding
- Accessibility for passengers with disabilities
- One journey from door to door

Airport and airline operations

- Faster aircraft turnaround
- Baggage tracking and recovery
- Crew and gate planning

Logistics and new mobility

- Drone delivery of medicines and parcels
- Regional and short-hop flights
- Electric air taxis

Sustainability and technology

- Fuel and carbon optimisation
- Sustainable aviation fuel
- Predictive maintenance

Real-world challenges

Challenge	Why it matters
Congestion	Airports grow slower than passenger numbers, so queues and delays rise.
Thin margins	Airlines earn little per seat and are very sensitive to fuel prices.
Fragmented journeys	Booking, airport, airline and onward travel rarely talk to each other.
Regulation and safety	Every new service needs approvals, and one incident can ground it.

Challenge	Why it matters
Sustainability pressure	Flying is hard to decarbonise and scrutiny is growing.

Startups for inspiration

- DigiYatra (India): Face-based, paperless passenger entry at airports.
- Skye Air (India): Drone delivery networks for parcels and medicines.
- The ePlane Company (India): Electric air taxis for short city hops.
- Assaia: AI that watches aircraft turnarounds to cut delays.
- SITA: Shared IT for airports and airlines: bags, check-in, data.
- Joby Aviation: Electric vertical take-off aircraft for urban air mobility.

Named for inspiration only: teams must not copy them, and the judge scores the team's own plan.

An illustrative concept: TURNWISE. Computer vision at the gate that tracks every step of an aircraft turnaround (fuelling, catering, baggage, cleaning) and warns the ground team before a delay happens. **How it could make money:** A subscription per gate for airports; a per-flight fee for airlines; delay-analytics reports for ground handlers.

What a strong PRD shows in this sector

- Which part of the value chain, which customer (airport, airline, passenger, shipper) and the pain in minutes, rupees or passengers
- An MVP that can be tested at one airport, route or fleet
- Approvals needed and how long they take
- Safety, reliability and data privacy
- Success metrics such as minutes saved, on-time %, cost per flight or passengers served

Round 2 · The four crisis cards

If Aviation is played, in crisis *k*, every Aviation company receives card *k* below, so all of them face the same numbers and can be compared fairly. The plan (500 words) is due 65 minutes after the reveal.

1 OPERATIONS Airport IT outage

CARD TEXT

> A software failure takes check-in, boarding passes and baggage systems down at 3 major airports for 9 hours. 31,000 passengers are affected and your product or service stops working with them.
>
> The twist: Airlines blame your product for slowing their recovery, although the outage was not yours. A news channel repeats it.
>
> Your plan must decide: Prove it was not you, or help first and argue later, and what you change so it cannot happen again.

ON THE CARD

- Check-in, boarding-pass and baggage systems fail at 3 major airports
- The outage lasts 9 hours
- 31,000 passengers are affected
- Your product or service stops working with them

WHAT IT DOES TO THE COMPANY

The service fails at the worst moment, in front of airports, airlines and passengers, and the cause is not even the company's own: its dependence on airport systems is exposed.

A STRONG CRISIS PLAN

- Keep customers moving with a manual fallback
- Keep airports, airlines and passengers informed while it lasts
- Build redundancy so the service runs when airport systems fail
- Estimate the cost of the downtime and of the fix

THE HIRED FIRM'S ADVICE SHOULD

Set the order of the first hours (who is served first, what runs by hand); agree what the company promises partners during outages; price redundancy against the cost of another 9-hour failure.

WHAT FUNDS WILL WATCH

How fast service returns, whether partners stay, and the cost of running independently of airport systems.

2 MARKET A giant builds its own

CARD TEXT

> The country's largest airline launches its own free version of your product for its passengers and partners. 30% of your users say they will switch within a quarter.
>
> The twist: The airline offers you a white-label contract: your product, their brand, a fixed fee, and no access to your users.
>
> Your plan must decide: Sign it, refuse it, or win the airline's rivals, with the revenue of each over a year.

ON THE CARD

- The country's largest airline launches its own free version of your product
- It is for the airline's passengers and partners
- 30% of your users say they will switch within a quarter

A STRONG CRISIS PLAN

- Serve the customers the giant ignores: other airlines, airports, smaller cities
- Or become the giant's supplier
- Show what each option is worth
- Keep the users who value what the free version lacks

WHAT IT DOES TO THE COMPANY

A powerful customer becomes a free competitor: a large share of users may leave, and the company's biggest channel may close.

THE HIRED FIRM'S ADVICE SHOULD

Find the users least tied to the giant's network; test whether the airline would rather buy than build; set a ceiling on what keeping users may cost.

WHAT FUNDS WILL WATCH

Actual switching against the 30% threat, and whether the company wins other airlines or a supply deal.

3 TRUST A safety incident under investigation

CARD TEXT

> A drone, aircraft or vehicle linked to your service is involved in an incident. No one is hurt, but the regulator opens an investigation and the video trends nationwide. Bookings fall 35%.
>
> The twist: Your operations lead tells you the incident report leaves out one maintenance check that was skipped.
>
> Your plan must decide: Correct the report or not, and what you change in safety before the regulator rules.

ON THE CARD

- A drone, aircraft or vehicle linked to your service is in an incident
- No one is hurt
- The regulator opens an investigation and the video trends nationwide
- Bookings fall 35%

A STRONG CRISIS PLAN

- Cooperate fully with the regulator
- Pause whatever is unsafe until it is checked
- Publish the findings and change procedures
- Show how long recovery takes and what it costs

WHAT IT DOES TO THE COMPANY

Safety is the licence to operate: bookings fall, and the investigation can pause or restrict the service.

THE HIRED FIRM'S ADVICE SHOULD

Separate the facts from the video; decide what to say and when; plan an independent safety review; model bookings recovering under realistic assumptions.

WHAT FUNDS WILL WATCH

The regulator's findings, how long any pause lasts, and whether bookings recover.

4 MONEY Jet fuel up 35%

CARD TEXT

> Jet fuel prices rise 35% in a month. Airlines, your customers or partners, cut spending on new projects by a quarter and delay paying your invoices by 60 days.
>
> The twist: A lender offers you a loan against your unpaid invoices at 18% interest.
>
> Your plan must decide: Borrow, cut costs, or ask customers to pay early for a discount. Show the cash runway of your choice.

ON THE CARD

- Jet fuel prices rise 35% in a month
- Airlines cut spending on new projects by a quarter
- Your invoices are paid 60 days later

WHAT IT DOES TO THE COMPANY

Less new business and slower payments at once: cash gets tight even though the company did nothing wrong.

A STRONG CRISIS PLAN

- Protect cash: renegotiate payment terms
- Show airlines how you save them fuel or money
- Cut costs
- Show the runway

THE HIRED FIRM'S ADVICE SHOULD

Model cash with payments 60 days later; rank customers by the savings the company brings them; propose terms that share those savings.

WHAT FUNDS WILL WATCH

Months of runway, overdue invoices, and whether the product becomes a way for airlines to save money.

Spare cards

Not loaded in the game. Use one to replace a card before the draw, in a rehearsal, or as a mid-round surprise announced in a bulletin.

- Drone flights are banned in two cities after a near-miss
- Bird strikes ground a fleet for inspection
- A data breach exposes passengers' travel history
- A new airport opens and moves a key route away
- A pilots' and crew strike cancels 40% of flights for a week

Round 3 · The ten problem statements

Each statement takes at most 5 companies. An Aviation company drafts only from this list, and writes its solution (600 words, 6 sections: our solution, why it fits the statement, how we stand apart, how we will build it, business impact, risks) with the firm it hires. Once uploaded, the game shows each statement as its title and a client brief: who it is for, the numbers, the catch and what winning looks like. The numbers are those of seed/sectors/all; a mix made with pnpm sectors numbers them again.

#	Statement	A strong solution shows
31	**Cut airport queue time from check-in to boarding by half** **Who it is for:** Passengers at a busy metro airport. **The numbers:** Check-in to boarding takes 75 minutes at peak, and 1 in 20 miss a flight because of queues. **The catch:** Security rules cannot change and space cannot grow. **You win if:** Under 35 minutes at peak, with no extra security staff. Up to 5 companies	Where passengers wait today and why, the change that removes it (digital ID, smarter staffing, data), how it is measured, and who pays: the airport or the airlines.

#	Statement	A strong solution shows
32	**Make air travel fully accessible for passengers with disabilities** **Who it is for:** Passengers who use wheelchairs, are blind or deaf, or have hidden disabilities. **The numbers:** 1 in 4 report a bad experience, and 1 in 10 a damaged wheelchair. **The catch:** Many staff are untrained and every airport works differently. **You win if:** Complaints halved and every passenger able to book help in one step. Up to 5 companies	Which barriers it removes (booking, airport, boarding, the aircraft), how assistance is arranged and tracked, and evidence passengers would use it.
33	**Turn aircraft around 20% faster without extra staff** **Who it is for:** A low-cost airline that earns only while its planes fly. **The numbers:** A turnaround takes 45 minutes; every 5 minutes saved is worth Rs 30 crore a year. **The catch:** The ground crew is already stretched and safety checks cannot be skipped. **You win if:** A 36-minute turnaround with the same staff and no new safety issues. Up to 5 companies	Which turnaround steps take longest, how the work is reorganised or monitored, how the time saved is measured, and what an airline saves per flight.
34	**Lost baggage found or delivered within 24 hours** **Who it is for:** Passengers whose bags are delayed or lost. **The numbers:** 7 bags in 1,000 go astray, and most take 3 days to return. **The catch:** Bags pass through airlines, airports and ground handlers who do not share data. **You win if:** 95% of bags back with their owner within 24 hours. Up to 5 companies	How bags are tracked and matched to passengers, how they are delivered, the cost per bag recovered, and who pays.
35	**Affordable flights to tier-3 towns with under 50 seats** **Who it is for:** People in towns 300 km from the nearest airport. **The numbers:** A 50-seat plane costs Rs 1.5 lakh an hour to fly, and flights must sell for under Rs 3,000. **The catch:** Small airports have short runways and few passengers on weekdays. **You win if:** A route that fills 70% of seats and covers its costs within a year. Up to 5 companies	The aircraft and routes, the cost per seat against the fares and demand you expect, airport limits, and the path to break-even.
36	**Drone delivery of medicines to hilly and remote areas** **Who it is for:** Clinics in hill and island areas waiting days for medicines. **The numbers:** A road trip takes 6 hours; a drone takes 30 minutes. **The catch:** Weather, the rules on flying and keeping medicines cold. **You win if:** 1,000 deliveries a month, on time, with every medicine safe on arrival. Up to 5 companies	Routes and payloads, the approvals needed, the cost per delivery against road transport, and how deliveries stay safe and reliable.

#	Statement	A strong solution shows
37	**Cut an airline's fuel use and carbon by 10% with data** **Who it is for:** An airline whose fuel is 40% of its costs. **The numbers:** A 10% saving is worth Rs 500 crore a year. **The catch:** Pilots, dispatchers and air traffic control all decide part of every flight. **You win if:** Fuel burn down 10% on the routes tested, measured flight by flight. Up to 5 companies	Which data and decisions (routes, weight, taxiing) create the saving, how it is verified, and how the company is paid from the savings.
38	**Sustainable aviation fuel from Indian farm waste** **Who it is for:** Airlines that must start blending sustainable fuel. **The numbers:** Sustainable aviation fuel costs 3× jet fuel; India burns 50 crore tonnes of crop waste a year. **The catch:** Collecting farm waste is seasonal and spread over thousands of villages. **You win if:** A pilot plant that makes fuel at under 2× the price of jet fuel. Up to 5 companies	The feedstock and process, the cost per litre against jet fuel, the approvals, and who buys the first output.
39	**One app for the whole door-to-door journey** **Who it is for:** Travellers who book a cab, a flight, a train and a hotel in five apps. **The numbers:** 1 in 3 journeys has a missed connection or a wasted hour. **The catch:** Every operator wants to own the customer. **You win if:** One booking that re-plans itself when anything is late, used by 1 lakh travellers. Up to 5 companies	Which steps it joins up (cab, airport, flight, onward travel), the partners it needs, and how it earns money.
40	**Predict and prevent aircraft part failures before they ground a plane** **Who it is for:** Maintenance teams of an airline with 80 planes. **The numbers:** A grounded plane costs Rs 50 lakh a day, and 30% of groundings come from part failures. **The catch:** Sensor data is huge and the regulator demands proof for every change. **You win if:** Groundings from part failures cut by half, with no missed safety check. Up to 5 companies	The data and the parts covered, how accurate the predictions are and how that is shown, and what each grounding avoided is worth.

What Finance teams should watch in this sector

Signal	Why
Contract dependence	Reliance on one airline or airport.
Regulatory approvals	Time and risk before revenue.
Fuel sensitivity	How the business behaves when fuel spikes.
Safety record	Incidents can stop operations.
Capital before revenue	Hardware and approvals cost cash early.

SECTION 7 · EXTRA SECTOR

Fintech

Financial services · ready to play: seed/sectors/all, or pnpm sectors for any mix

Digital payments, app-based investing and online lending have reached hundreds of millions of people, but fraud, poor financial literacy, unfair credit and complex regulation remain. Fintech businesses live on trust and on the regulator's rules, so a breach, a market crash or a rule change moves them immediately, and Finance teams will know how to trade them.

Round 1 · The problem statement

CARD TEXT · EXTRA SECTOR

Financial services

The financial services industry is undergoing a rapid digital transformation as consumers and businesses increasingly expect seamless payments, personalized financial solutions, instant access to credit, enhanced security, and greater financial transparency. However, millions of individuals and businesses continue to face challenges such as limited access to formal financial services, financial fraud, inefficient lending processes, low financial literacy, fragmented financial management, regulatory compliance complexities, and growing cybersecurity risks. At the same time, financial institutions struggle to leverage emerging technologies while maintaining customer trust, operational efficiency, and regulatory compliance. Design an innovative startup that addresses one or more of these interconnected challenges to help create a more accessible, secure, intelligent, and inclusive financial ecosystem while delivering measurable value to consumers, businesses, and financial institutions.

Every Product team in this sector invents its own startup inside this statement and describes it in its PRD (800 words, 7 sections: problem and target user, proposed solution, core features and MVP scope, success metrics, business model, competitive edge, key risks).

Opportunity areas

Access and credit

- Credit for people and shops without credit history
- Invoice and supply-chain finance
- Microinsurance

Investing and wealth

- Robo-advice and ready-made portfolios
- Protecting first-time investors
- Quantitative and algorithmic tools used responsibly

Security and compliance

- Fraud detection for UPI and cards
- Automated KYC and compliance
- Explainable, auditable AI

Money management

- One view of all accounts
- Financial literacy that changes behaviour
- Saving and retirement for gig workers

Real-world challenges

Challenge	Why it matters
Exclusion	Many people and small businesses have no credit history, so banks will not lend to them.
Fraud	Every new payment method attracts new scams.
Literacy	New investors trade on tips and lose money in risky products.
Regulation	Rules change often, and compliance is costly for small firms.

Challenge	Why it matters
Trust and security	One breach or bad algorithm can lose millions of users.

Startups for inspiration

- Zerodha / smallcase (India): Low-cost investing and ready-made portfolios.
- Groww (India): Simple investing for first-time investors.
- Jupiter / Fi (India): App-first banking for young earners.
- Lendingkart (India): Data-driven loans for small businesses.
- Wealthfront (US): Robo-advice with automated rebalancing.

Named for inspiration only: teams must not copy them, and the judge scores the team's own plan.

An illustrative concept: KHATAPLUS. A cash-flow credit score for kirana shops built from their UPI receipts and supplier bills (with consent). Lenders use it to give small working-capital loans that the shop repays from daily sales.
How it could make money: A fee per score for lenders; a share of interest on loans arranged; a premium bookkeeping app for shops.

What a strong PRD shows in this sector

- The user (a person, a shop, a lender) and the money problem in rupees
- How the product makes money and what it costs to acquire a user
- Risk controls: defaults, fraud, model errors
- Regulatory fit: which rules apply and how the product complies
- Success metrics such as default rate, fraud caught, users retained or cost per loan

Round 2 · The four crisis cards

If Fintech is played, in crisis *k*, every Fintech company receives card *k* below, so all of them face the same numbers and can be compared fairly. The plan (500 words) is due 65 minutes after the reveal.

1 OPERATIONS The algorithm misfires

CARD TEXT

> A bug in your model makes 6,000 wrong trades or loan decisions in one morning. Customers lose Rs 2.1 crore before you stop it.
>
> The twist: A customer who lost Rs 9 lakh goes on TV; your lawyers advise you to refund nobody until the cause is proven.
>
> Your plan must decide: Refund everyone now, refund case by case, or wait. Show the cost, and what you change in the model.

ON THE CARD

- A bug in your model makes 6,000 wrong trades or loan decisions
- It happens in one morning
- Customers lose Rs 2.1 crore before you stop it

WHAT IT DOES TO THE COMPANY

Customers lose real money because of the company's own system: compensation, the regulator's attention and trust are all at stake.

A STRONG CRISIS PLAN

- Stop it at once
- Make customers whole
- Find the root cause
- Add controls (limits, human review, testing) and cost the compensation

THE HIRED FIRM'S ADVICE SHOULD

Set the order of the response (stop, compensate, explain); size compensation against the Rs 2.1 crore; design the controls that would have caught the bug.

WHAT FUNDS WILL WATCH

The size of the compensation, any action by the regulator, and whether users stay.

2 MARKET A market crash

CARD TEXT

> The market falls 14% in five days. Your users' portfolios (or your borrowers' sales) drop sharply, and 25% of users stop using the app.
>
> The twist: Influencers tell your users to 'buy the dip' with borrowed money, using your app's name.
>
> Your plan must decide: Warn your users even if trading falls, or stay quiet. How you protect users from the worst losses.

ON THE CARD

- The market falls 14% in five days
- Users' portfolios (or borrowers' sales) drop sharply
- 25% of users stop using the app

WHAT IT DOES TO THE COMPANY

Revenue tied to activity or loans falls, defaults may rise, and a quarter of users have gone quiet.

A STRONG CRISIS PLAN

- Communicate early
- Help users avoid panic decisions
- Protect the business from defaults or outflows
- Show the runway

THE HIRED FIRM'S ADVICE SHOULD

Group users by risk; design the messages and tools that prevent panic selling; stress-test defaults on the loan book.

WHAT FUNDS WILL WATCH

How many users come back, default rates, and money flowing out.

3 TRUST A data breach

CARD TEXT

> Hackers leak the phone numbers and PAN details of 3 lakh users. Fraud calls start the same day and the news covers it.
>
> The twist: The hackers claim they still have access, and your security team cannot yet prove they are wrong.
>
> Your plan must decide: Shut the app until it is safe, or stay open with extra checks. What it costs and what users are told.

ON THE CARD

- Hackers leak the phone numbers and PAN details of 3 lakh users
- Fraud calls start the same day
- The news covers it

A STRONG CRISIS PLAN

- Notify users and the regulator
- Contain the breach
- Protect users from fraud
- Fix security; estimate the cost and the users at risk

WHAT IT DOES TO THE COMPANY

Users face fraud now, the regulator must be told, and trust, the company's main asset, is damaged.

THE HIRED FIRM'S ADVICE SHOULD

Set the order of notification and containment; protect users from the fraud calls; plan the security fixes and an independent audit.

WHAT FUNDS WILL WATCH

Users lost, any fine or order from the regulator, and the cost of the response.

4 MONEY The regulator changes the rules

CARD TEXT

> The central bank tightens rules on your product: digital lending caps, new KYC checks, or limits on derivatives for small investors. Revenue from your main product falls 40%.
>
> The twist: A rival keeps selling the old product through an offshore company and takes your users.
>
> Your plan must decide: Follow the rules and lose users, or find a compliant product that wins them back. Show revenue for both.

ON THE CARD

- The central bank tightens the rules on your product
- Lending caps, new KYC checks or limits on derivatives for small investors
- Revenue from your main product falls 40%

A STRONG CRISIS PLAN

- Comply first
- Rebuild revenue from what the rules still allow
- Show the new business model in numbers

WHAT IT DOES TO THE COMPANY

The business model changes overnight: the main product earns 40% less and compliance costs rise.

THE HIRED FIRM'S ADVICE SHOULD

Map exactly what the new rules allow; size new sources of revenue; budget for compliance.

WHAT FUNDS WILL WATCH

Revenue after the change, compliance costs, and how fast the new model grows.

Spare cards

Not loaded in the game. Use one to replace a card before the draw, in a rehearsal, or as a mid-round surprise announced in a bulletin.

- A partner bank ends its agreement with you at a month's notice
- A loan-default wave hits after a bad monsoon
- A deepfake video of your CEO promotes a scam

- UPI transaction charges are introduced
- A rival offers zero fees for a year

Round 3 · The ten problem statements

Each statement takes at most 5 companies. A Fintech company drafts only from this list, and writes its solution (600 words, 6 sections: our solution, why it fits the statement, how we stand apart, how we will build it, business impact, risks) with the firm it hires. Once uploaded, the game shows each statement as its title and a client brief: who it is for, the numbers, the catch and what winning looks like. The numbers are those of seed/sectors/all; a mix made with pnpm sectors numbers them again.

#	Statement	A strong solution shows
41	**Stop first-time investors losing money in options** **Who it is for:** First-time investors under 25 who trade options on their phones. **The numbers:** 9 in 10 small options traders lose money; their average loss is Rs 1.1 lakh a year. **The catch:** Options trading earns brokers money, and users want excitement. **You win if:** Users who lose less, measured over 6 months, and a business that still earns. Up to 5 companies	Who the users are, how the product steers them away from losses (education, limits, safer alternatives), how that is measured, and how it earns money without encouraging risky trading.
42	**Fair credit for kirana shops with no credit history** **Who it is for:** Kirana owners who need Rs 50,000 for stock before a festival. **The numbers:** Moneylenders charge 4% a month; banks refuse loans to shops without a credit history. **The catch:** No papers, irregular income and cash sales. **You win if:** Loans within a day at under 2% a month, with under 3% unpaid. Up to 5 companies	The data used instead of a credit history, how fairness is checked, the defaults you expect, and the cost per loan.
43	**Detect UPI fraud before the money leaves** **Who it is for:** UPI users who are tricked into sending money. **The numbers:** Fraud losses are rising each year, and most of the money is never recovered. **The catch:** Payments settle in seconds and false alarms annoy honest users. **You win if:** Fraud stopped before the money leaves in 8 cases out of 10, with under 1 honest payment in 1,000 stopped. Up to 5 companies	The signals used, how fast a decision is made, false alarms against fraud caught, and who pays: banks, apps or users.
44	**Explain a portfolio's risk in one screen** **Who it is for:** Savers with 5 to 15 mutual funds and stocks they no longer remember buying. **The numbers:** Most cannot say what they would lose in a bad year. **The catch:** Risk is complex, and simple screens hide what matters. **You win if:** A screen that 8 in 10 users understand in a test, and that leads them to act. Up to 5 companies	What the screen shows, how it is tested with real users, and evidence that it changes their decisions.

#	Statement	A strong solution shows
45	**Retirement saving for gig workers** **Who it is for:** Delivery riders and drivers with no employer pension. **The numbers:** A rider earns about Rs 20,000 a month, and earnings change weekly. **The catch:** Money is tight now and retirement feels far away. **You win if:** 1 lakh gig workers saving every month for a year. Up to 5 companies	How saving fits an irregular income, the product and its costs, how users are reached, and the savings built per user.
46	**Insurance claims settled in a day** **Who it is for:** Families claiming health or motor insurance. **The numbers:** A claim takes 15 to 30 days and 1 in 5 is disputed. **The catch:** Insurers fear fraud, and hospitals and garages have their own systems. **You win if:** 80% of claims settled within 24 hours, with fraud no higher than today. Up to 5 companies	Which claims, how they are checked fast without letting fraud through, the cost per claim, and who pays.
47	**Invoice finance for small exporters** **Who it is for:** Small exporters waiting 90 days to be paid by foreign buyers. **The numbers:** Unpaid invoices lock up 30% of their working capital; banks ask for property as security. **The catch:** Buyers are abroad, in other currencies and under other laws. **You win if:** Invoices paid in 48 hours at under 1.5% a month. Up to 5 companies	How invoices are verified, the cost of money and the risk of default, the time to cash, and the price to exporters.
48	**Financial literacy that changes behaviour, not just knowledge** **Who it is for:** Young earners in their first job. **The numbers:** Most know what a SIP is, but under 20% have one; credit-card debt is rising. **The catch:** Knowing is not doing, and lessons are boring. **You win if:** Users who start saving and stay out of expensive debt, measured after 6 months. Up to 5 companies	The behaviour it targets, how the product changes it (nudges, practice, incentives), and how the change is measured.
49	**Credit scores from cash-flow data, with consent** **Who it is for:** Small businesses and young people with no credit card or loan history. **The numbers:** Bureau scores cover only a part of adults. **The catch:** Data from bank accounts and GST must be shared with consent, and kept safe. **You win if:** Loans to 50,000 people without a bureau score, with repayments as good as with one. Up to 5 companies	The data used, how consent is taken and managed, accuracy against real repayments, and who pays for the score.

#	Statement	A strong solution shows
50	**Responsible AI that a regulator can audit** **Who it is for:** Lenders and insurers that use AI to say yes or no. **The numbers:** Customers cannot ask why they were refused, and regulators are starting to ask. **The catch:** Explaining a model can reveal secrets or make it worse. **You win if:** A system that explains every decision and passes an outside audit, with no loss in accuracy. Up to 5 companies	Which decisions it covers, how each decision is explained and logged, how bias is tested, and what an audit looks like.

What Finance teams should watch in this sector

Signal	Why
Regulatory risk	A rule change can cut revenue overnight.
Default and loss rates	The core risk of lending.
Retention after a shock	Trust is the asset.
Revenue concentration	Dependence on one product or partner bank.
Cost of compliance	Cash needed just to stay legal.

Appendix A · How every answer is judged

The AI judge scores each submission three times against these rubrics (five times if the three differ by more than 10 points) and keeps the median. Names are hidden, so every team is judged by the same standard. A score is out of 100.

Round 1 · The PRD (Product, 800 words)

Line	What earns points	Max
Problem	A specific problem, the user who has it, how many people have it and what it costs them today	**20**
Solution	A solution that clearly fixes that problem, with a small first version (MVP) whose core features are named and in scope	**20**
Metrics	Measurable signs of success, with targets and a time frame, that show whether the product works	**15**
Business model	Who pays, how much and how often, and whether that revenue can cover the costs	**15**
Feasibility	Whether a small team could build and run it with its seed money, why it beats the alternatives, and the main risks with a plan for each	**15**
Clarity	A PRD that is well organised, specific and easy to act on, with no filler	**15**

Round 1 · The consulting memo (Consulting, 500 words)

Line	What earns points	Max
Diagnosis	What went wrong, why it matters and what it costs Kaveri each week, using the case's facts	**25**
Options	Two or more real options, with what each one costs, gains and risks	**20**
Recommendation	One clear choice that follows from the diagnosis and options, with the reason	**20**
Numbers	Costs, revenue at risk, cash and timing that are correct and add up	**15**
Risks	What could go wrong with the recommendation and how to reduce it	**10**
Next steps	Concrete actions for this week, with who does them and by when	**10**

Round 2 · The crisis plan (Product, 500 words)

Sections: the crisis and what it does to us · our response · the money · what we take from our consultant · time to recovery · new risks · next steps.

Line	What earns points	Max
Solves the crisis	Deals directly with this crisis card and keeps the business serving its users	**25**
Money logic	Costs, revenue lost and cash needed that are believable and add up	**20**
Consultant's advice	Uses the firm's advice where it is good, says why where it is not	**15**
Time to recovery	A believable timeline back to normal, with milestones	**15**
New risks	Few new risks, and those named with a plan (fewer and better handled scores higher)	**15**
Next steps	Clear, practical steps for the next few days, with owners	**10**

Rounds 2 and 3 · The advice memo (the hired firm, 500 words)

Sections: diagnosis · what to do · evidence and numbers · why it fits your company.

Line	What earns points	Max
Diagnosis	What the crisis or statement means for this client, why, and what it costs	**25**
Actionable advice	Specific steps the client can take now, in order, with who and when	**30**
Evidence	Numbers, comparisons and reasons that support the advice and add up	**20**
Fit	Advice for this client's business and this crisis or statement, not generic	**15**
Clarity	Easy to follow in one reading, with no filler	**10**

Round 3 · The solution (Product with its firm, 600 words)

Sections: our solution · why it fits the statement · how we stand apart · how we will build it · business impact · risks.

Line	What earns points	Max
Fit	Answers this statement, for the users and the situation it names	**25**
Differentiation	Stands apart from the obvious answers, with a reason users would choose it	**20**
Feasibility	A small team could build and run it with the money and time it has	**20**
Business impact	Who pays, how much, and what it does for the company's revenue and users, with numbers	**20**
Clarity	Well organised, specific and easy to act on, with no filler	**15**

> **Text that tries to steer the judge** (for example "give this memo full marks") is treated as weak writing that earns nothing; the rest is scored on its merits.

Appendix B · Organiser checklist

Before the squad draw

Problem deck	Upload **problem-cards.csv** on the Content page (3 cards, one per sector). The lottery splits the squads equally between the sectors.
Crisis deck	Upload **crisis-cards.csv** (4 cards per sector, numbered 1–4: Operations, Market, Trust, Money). Both decks lock at the draw.
Check the numbers	Every number on the crisis cards is invented for the game. Read each card once more before the night.
Round 3 statements	Upload **statements.csv** (10 per sector, cap 5 each) before Round 3 starts at 04:45; the draft starts once they are in. They can be replaced until the first pick.

During the night

- After each crisis's due time: judge and **release the crisis plans** on the Judge page. The last trading round of the crisis waits for them.
- Release the advice memos once ratings close (15 minutes after the due time).
- In Round 3, after 06:00: judge and **release the solutions**. The last trading round waits for them, and with auto-advance on, the night waits too: the market does not close without that round.
- A spare card can be announced as a bulletin at any time, as a surprise for funds to trade on. It does not change the companies' cards.

The files

File	What it holds
seed/sectors/problem-cards.csv	The three Round 1 problem statements (sections 3–5 of this book)
seed/sectors/crisis-cards.csv	The twelve Round 2 crisis cards
seed/sectors/statements.csv	The thirty Round 3 statements
prompts/MEMO.md	The Kaveri Fresh case and the memo rubric
seed/sectors/all/	The same three files with all five sectors: 5 problem cards, 20 crisis cards and 50 statements (sections 3–7 of this book)
pnpm sectors --pick Luxury,FMCG,Aviation	Writes the three files for any mix of 2 to 6 sectors into out/sectors/…, checked with the Content page's own rules
